Machine Learning. Lecture 3:

SVM, PCA

Ivan Solomatin

Outline

- 1. Support Vector Machine (SVM)
- 2. Dimensionality reduction and PCA
- 3. Validation strategies

Support Vector Machine

girafe ai

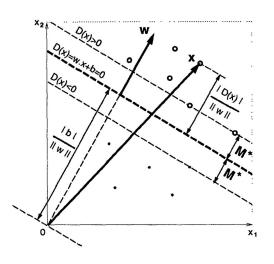

Support Vector Machine

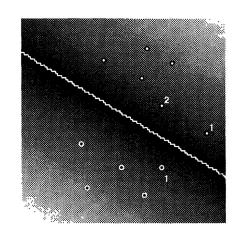

- 1. History
- 2. Motivation
- 3. Solution for separable design
- 4. Inseparable design, soft margin
- 5. Kernels
 - a. Kernel definition (Hilbert spaces, inner product, positive semidefiniteness)
 - b. Kernels properties (addition, infinite sums)
 - c. Types of kernels (poly, exponential, gaussian)
- 6. Current state

History

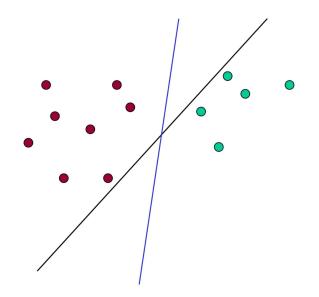

1963: SVM introduced by Soviet mathematicians Vladimir Vapnik and Alexey Chervonenkis

1992: kernel trick (Vapnik, Boser, Guyon)

1995: soft margin (Vapnik, Cortes)

Motivation

Linear separable case

Many separating hyperplanes exist

Maximize width

Margin

$$y \in \{1, -1\}$$

$$y_i = 1 : w^T x_i - c > 0$$

$$y_i = -1 : w^T x_i - c < 0$$

$$c_+(w) = \min_{y_i = 1} (w^T x_i)$$

$$c_-(w) = \max_{y_i = -1} (w^T x_i)$$

$$\rho\left(\frac{w_0}{\|a_0\|}\right) = \frac{1}{\|a_0\|}$$

$$c_{-}(w)$$

$$\frac{1}{|w_0||}$$

Optimization problem

$$y_i = 1 : w^T x_i - c > 0$$

$$y_i = -1 : w^T x_i - c < 0$$

$$M_i = y_i \cdot (w^T x_i - c)$$

$$\rho(w) = \frac{1}{||w||} \to \max_{w,c}$$

s.t.
$$y_i(w^T x_i - c) \ge 1$$

Convex problem!

$$L(w, c, \alpha) = \frac{1}{2}w^Tw - \sum_{i} \alpha_i (y_i(w^Tx_i - c) - 1)$$
Many of them are

zeros

Hinge loss

$$L(w, c, \alpha) = \frac{1}{2} w^T w - \sum_{i} \alpha_i (y_i (w^T x_i - c) - 1)$$

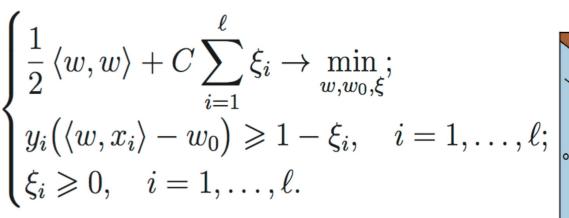

$$L^{\text{hinge}} = (1 - M)_{+}$$

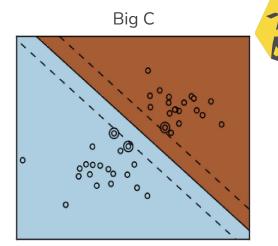

$$L(w, c, \alpha) = \frac{1}{2}||w||_2^2 + \sum_{i} \alpha_i L_i^{\text{hinge}}$$

Inseparable case

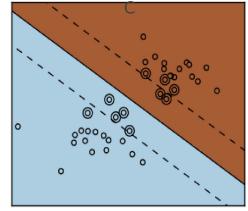

Let our model mistake, but penalize that mistakes

Implemented via margin slack variables

Kernel trick

$$y_i = 1 : w^T x_i - c > 0$$

$$y_i = -1 : w^T x_i - c < 0$$

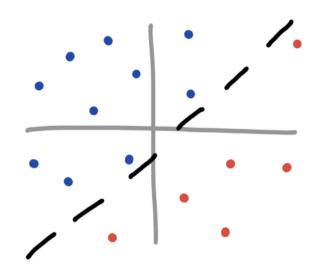

$$x \mapsto \phi(x)$$

$$w \mapsto \phi(w) \implies \langle w, x \rangle \mapsto \langle \phi(w), \phi(x) \rangle$$

$$K(w,x) = \langle \phi(w), \phi(x) \rangle$$

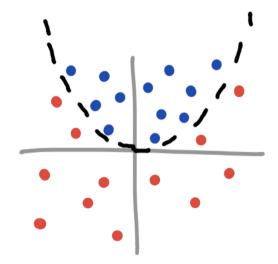

Kernel types

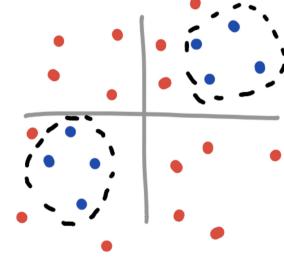

$$K(w,x) = < w, x >$$

Linear

$$K(w, x) = (\gamma < w, x > +r)^d$$

Polynomial

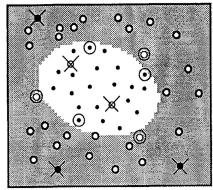

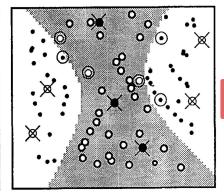

$$K(w,x) = e^{-\gamma ||w-x||^2}$$

Gaussian radial basis function

Current state

Principal Component Analysis

girafe ai

Principal Component Analysis

$$x_1,\ldots,x_n\to g_1,\ldots,g_k,k\leq n$$

$$U: UU^T = I, G = XU$$

$$\hat{X} = GU^T \approx X$$

$$||GU^T - X|| \to \min_{G,U} s.t. rank(G) \le k$$

Singular value decomposition

$$||GU^T - X||_2 \leftarrow \min_{G,U} s.t.rank(G) \le k$$

$$X = V\Sigma U^{T} : ||GU^{T} - V\Sigma U^{T}||_{2} = ||G - V\Sigma||_{2}$$

$$G = V\Sigma' : ||V\Sigma' - V\Sigma||_2 = ||\Sigma' - \Sigma||_2$$

$$||A||_2 = \sigma_{max}(A) : ||\Sigma' - \Sigma||_2 = \sigma_k(\Sigma) = \sigma_k(X)$$

Eckart-Young-Mirsky theorem

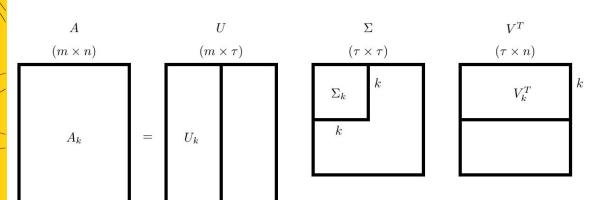

Singular value decomposition

$$||GU^T - X|| \to \min_{G,U} s.t. rank(G) \le k$$

$$X = V \Sigma U^T$$

$$\sigma_k(\Sigma) = \sigma_k(X)$$

Eckart–Young–Mirsky theorem

Another approach

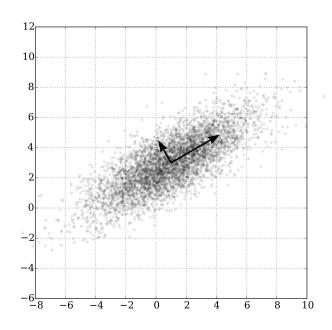

Residual variance maximization

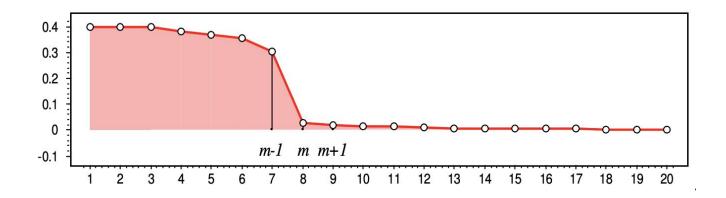

Take new basis vectors greedy

Same result for G and U

Always normalize data before PCA!!!

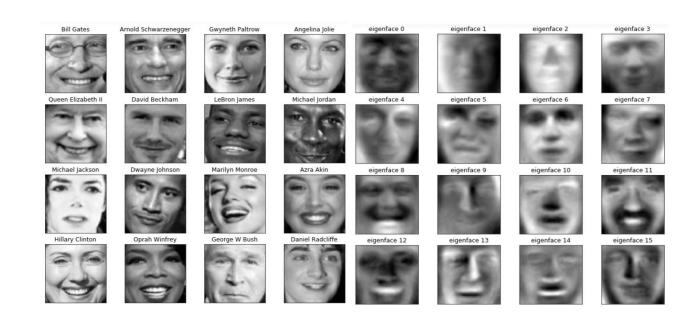

Get rid of low-variance components

$$E_m = \frac{\|GU^{\mathsf{T}} - F\|^2}{\|F\|^2} = \frac{\lambda_{m+1} + \dots + \lambda_n}{\lambda_1 + \dots + \lambda_n} \leqslant \varepsilon.$$

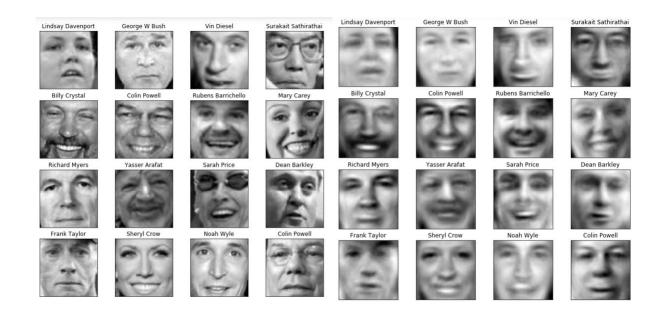

Let's walk through space...

16 components

50 components

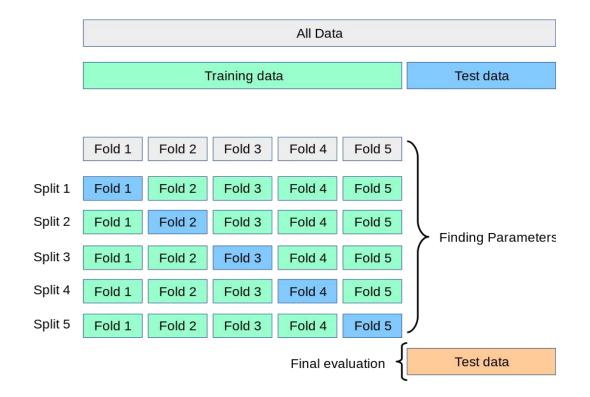

250 components

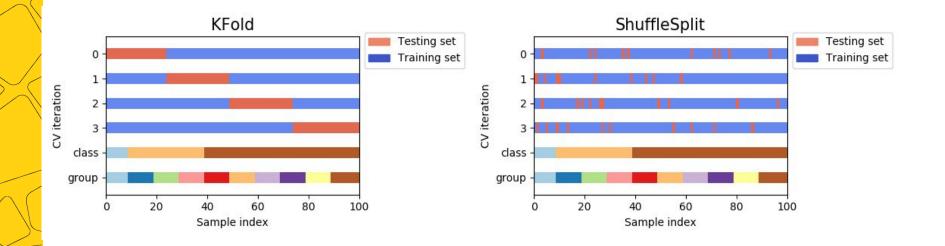

girafe ai

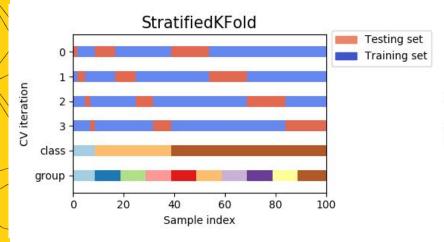

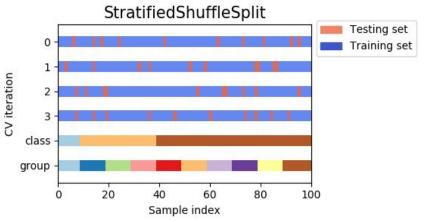

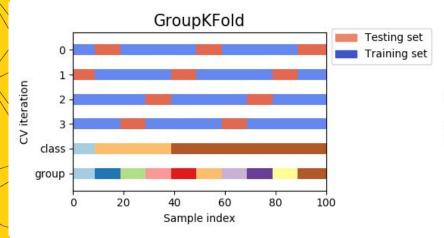

Special case: Leave One Out (LOO) - good for tiny datasets

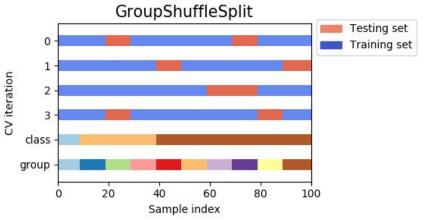

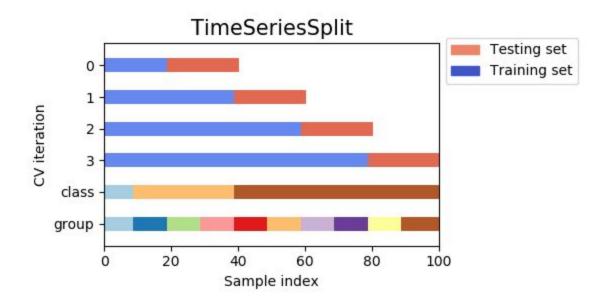

Special case: time series

Never use train_test_split in this case!!!

Revise

- 1. Support Vector Machine (SVM)
- 2. Dimensionality reduction and PCA
- 3. Validation strategies

Thanks for attention!
